

OldPhoneDeals eCommerce Web Application

Presented by Tutorial 8 - Group 5
Faculty of Engineering,
COMP5347 Group Based Assignment

Project Overview

Development a Single Page Application(SPA) using the **MEAN stack (MongoDB, Express.js, Angular, Node.js)** to simulate the trading of second-hand mobile devices.

The system features a dual-interface architecture for seamless user transactions and robust administrative management, all built on **asynchronous MVC** design principles.

MVC Architecture

Model (Data)

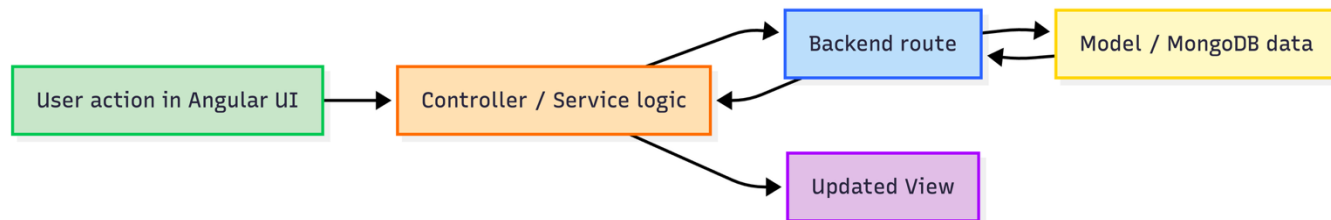

- Defines what data our system stores and the rules for that data.
- For example, [Phone Listing](#) stores title, brand, price, stock, reviews, and rating statistics, while User stores personal information, cart, and wishlist.

View (UI)

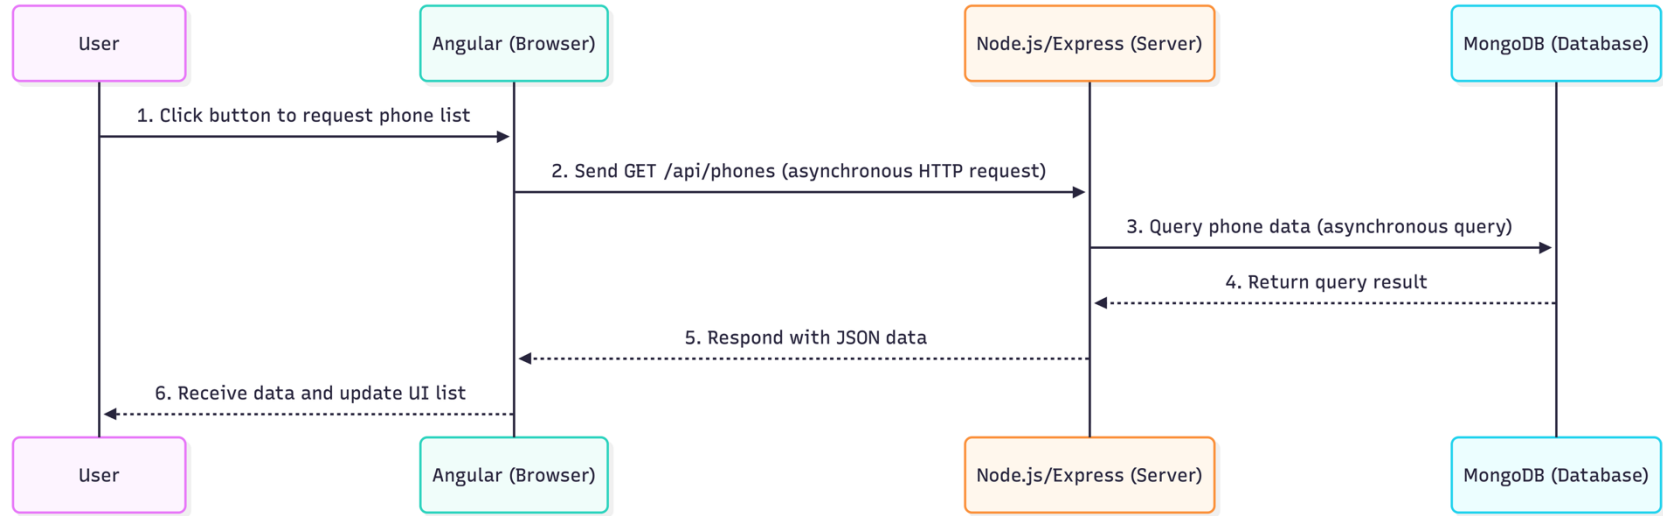

- The presentation layer. For example, Angular templates display product images, titles, prices, ratings, and stock information to the user.

Controller (Logic)

- Handles the application logic. For example, when a user requests phone listings, the route in [phoneRoutes.ts](#) receives the request, applies filtering or sorting, gets data from the model, and sends the result back to the frontend.

System Interaction Sequence Diagram

User Verification & Activation

Secure Password Storage

- **bcrypt Hashing:** Automatically generates a unique salt per user to compute a secure cryptographic hash, which is stored directly in MongoDB.

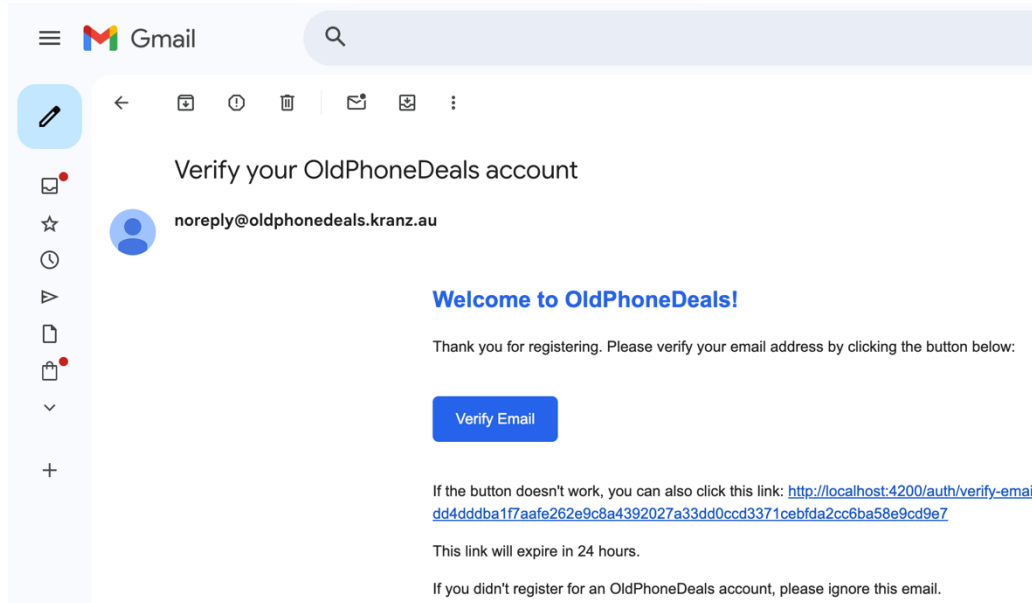

Time-Sensitive Token Generation

- **JWT:** Utilizes `jsonwebtoken` to issue verification tokens embedding the User ID, enforced with a 24-hour expiration window.

Token Validation & Route Protection

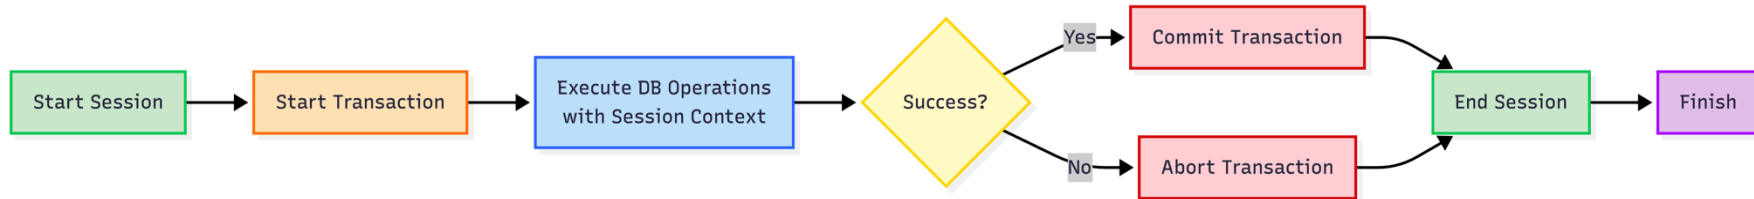

- **Signature Verification:** Backend executes `jwt.verify()` to validate the signature and expiration. Transitioning the user status from Pending to Active when success.
- **Auth Middleware:** Restricts sensitive routes by intercepting authentication attempts from pending accounts, blocking unauthorized access with a **403 Forbidden error**.

User Verification & Activation Implementation

Transaction Atomicity & ACID Compliance

Mongoose Transaction Lifecycle Management

Database operations during transaction

- **Order Creation:** Inserts a new transaction record into the orders collection.
- **Stock Decrement:** Deducts purchased quantities from `stock_quantity` field in listings collection.
- **System Notification:** Generates a real-time alert entry for administrative monitoring.
- **User Cart Clearance:** Clear cart array nested within the target user's document in `userscollection`.
- **Audit Trail Logging:** Commits a record to the sales and activity history logs.

Sold Out Soon & Best Sellers Implementation

Homepage Design - Sold Out Soon Pipeline

"Sold Out Soon" Calculation

- Fetched products with stock greater than 0
- Sorts by stock in ascending order
- Returns the 5 products with the lowest remaining stock

```
fetchSoldOutSoon(): void {  
  this.isLoadingSoldOutSoon = true;  
  this.soldOutSoonError = null;  
  const filters: PhoneListingFilters = {  
    sortBy: 'stock',  
    order: 'asc',  
    limit: 5,  
    minStock: 1,  
    state: IsDisabledState.ENABLED,  
  };  
};
```

Homepage Design - Best Sellers Pipeline

"Best Sellers" Calculation

- Fetched products with available stock and at least 2 ratings
- Sorts by the stored `averageRating` in descending order
- Hidden reviews are still included when calculating `averageRating`

```
fetchBestSellers(): void {  
  this.isLoadingBestSellers = true;  
  this.bestSellerError = null;  
  const filters: PhoneListingFilters = {  
    sortBy: 'rating',  
    order: 'desc',  
    limit: 5,  
    minStock: 1,  
    minNumRatings: 2,  
    state: IsDisabledState.ENABLED,  
  };  
};
```

Performance Optimization - N+1 Queries

N+1 Query Prevention

- Uses Mongoose `populate()` to load sellers and review authors together
- Avoids querying related data separately for each product or review

```
const query = PhoneListingModel.find(filter)
  .populate('seller', 'firstname lastname')
  .populate('reviews.reviewer', 'firstname lastname')
  .sort(sortObject)
  .skip(skip)
  .limit(limitNumber);
```

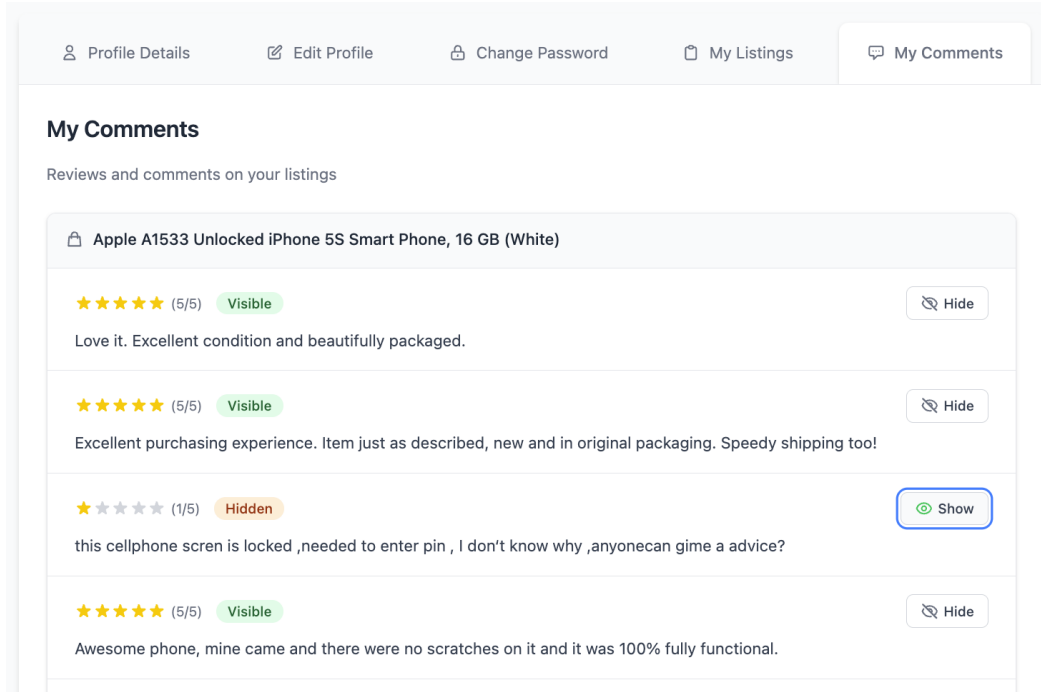

Role-Based Access Control for Comments

Layered Middleware Pipeline (Granular Access Control)

- 1. validateToken (Authentication Layer):** Verify signature of `JWT` from request header.
If token is valid, it decodes the payload (incl. `userId` and `role`) and attaches it to the `req` object.
- 2. checkReviewPermissions (Authorization Layer):** Handle domain-specific business logic.
For comments, it fetches the relevant review and product from the database. Then, it compares the current `user's ID` and role (`req.user`) against the data to determine their permissions.

Comments Implementation - Seller Interface

Listing owner can Show or Hide the comments below his/her phone listings

The screenshot displays the 'My Comments' section of a seller's interface. At the top, there is a navigation bar with links: Profile Details, Edit Profile, Change Password, My Listings, and My Comments (which is highlighted). Below the navigation bar, the section is titled 'My Comments' with a subtitle 'Reviews and comments on your listings'. The main content area shows a list of comments for a specific listing, 'Apple A1533 Unlocked iPhone 5S Smart Phone, 16 GB (White)'. Each comment entry includes a star rating, a status label ('Visible' or 'Hidden'), a 'Hide' or 'Show' button, and the comment text. The third comment, which has a 1/5 star rating and is marked as 'Hidden', has its 'Show' button highlighted with a blue border.

🔒 Apple A1533 Unlocked iPhone 5S Smart Phone, 16 GB (White)

★★★★★ (5/5) Visible Hide

Love it. Excellent condition and beautifully packaged.

★★★★★ (5/5) Visible Hide

Excellent purchasing experience. Item just as described, new and in original packaging. Speedy shipping too!

★☆☆☆☆ (1/5) Hidden Show

this cellphone screen is locked ,needed to enter pin , I don't know why ,anyone can give me advice?

★★★★★ (5/5) Visible Hide

Awesome phone, mine came and there were no scratches on it and it was 100% fully functional.

Comments Implementation - Role-Based Control

☐ Make this review private (only visible to you and the seller)

Submit Review

Peter Martinez
★★★★★
Love it. Excellent condition and beautifully packaged.

Marc Weekly
★★★★★
Excellent purchasing experience. Item just as described, new and in original packaging. Speedy shipping too!

Session Expiration Warning Mechanism

Warning Mechanism

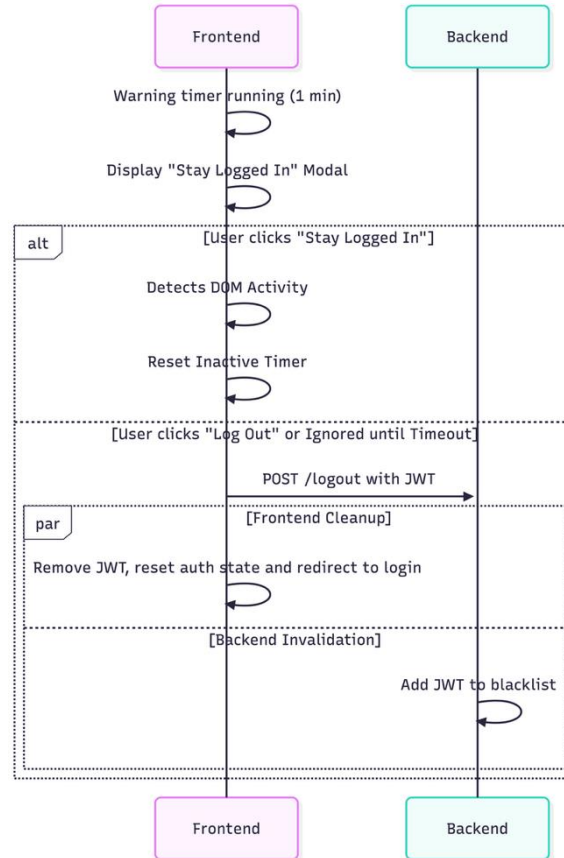

When admin login, Angular `AdminAuthService` starts two timers to monitor session validity.

1. **Main Inactivity Timer:** Set to the JWT's full lifetime (1 minute).
2. **Warning Timer:** Set to trigger 30 second before expiration.

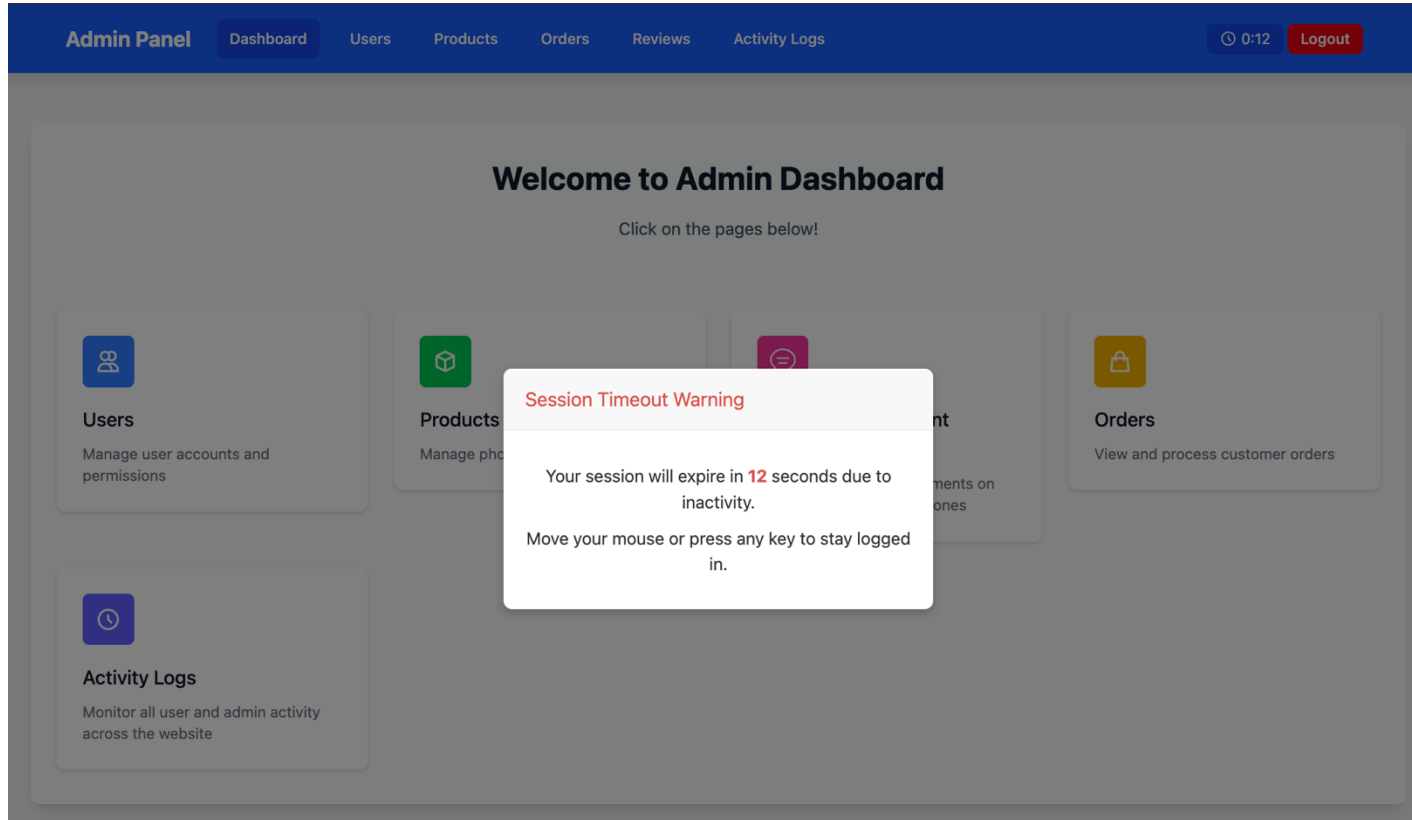

Timer Reset on User Activity

- Service listens for global `DOM events` like mousemove, keypress, and scrolling.
- Any detected user activity calls a `resetInactiveTimer()`, which clears existing timers and restarts.

Session Expiration Lifecycle Sequence

Session Expiration Warning Implementation

Technical Highlights - Architecture & Auth

SPA Principle

- Home / Search / Item views load within the same page **without reload**
- All client-server communications are **asynchronous**

MVC Architecture

- Clear separation of **Model (data)**, **View (UI)**, and **Controller (logic)** for maintainability and scalability

User Information Security

- **bcrypt hashing** and **salted**
- email must be **verified before login**
- password can **reset via email link**

Technical Highlights - Data Integrity & Security

Database Architecture & Transaction Integrity

- **MongoDB** dynamic schema (**NoSQL**)
- **ACID-Compliant Transactions**

Performance & Security

- **Proper indexing** and Mitigated **N+1 Query** Bottlenecks
- Granular **Role-Based Access Control (RBAC)**
- Synchronized **Session Lifecycle & Revocation**
- Prevented **XSS** attacks
 - Angular template interpolation automatically escapes user-generated content, e.g. `{{ userReview.comment }}`

Thank you!
